

# Operating Systems

## Virtual Memory-Page Replacement

Seyyed Ahmad Javadi

[sajavadi@aut.ac.ir](mailto:sajavadi@aut.ac.ir)

Fall 2023

# What Happens if There is no Free Frame?

---

- Used up by process pages
- Also in demand from the kernel, I/O buffers, etc
- How much to allocate to each?

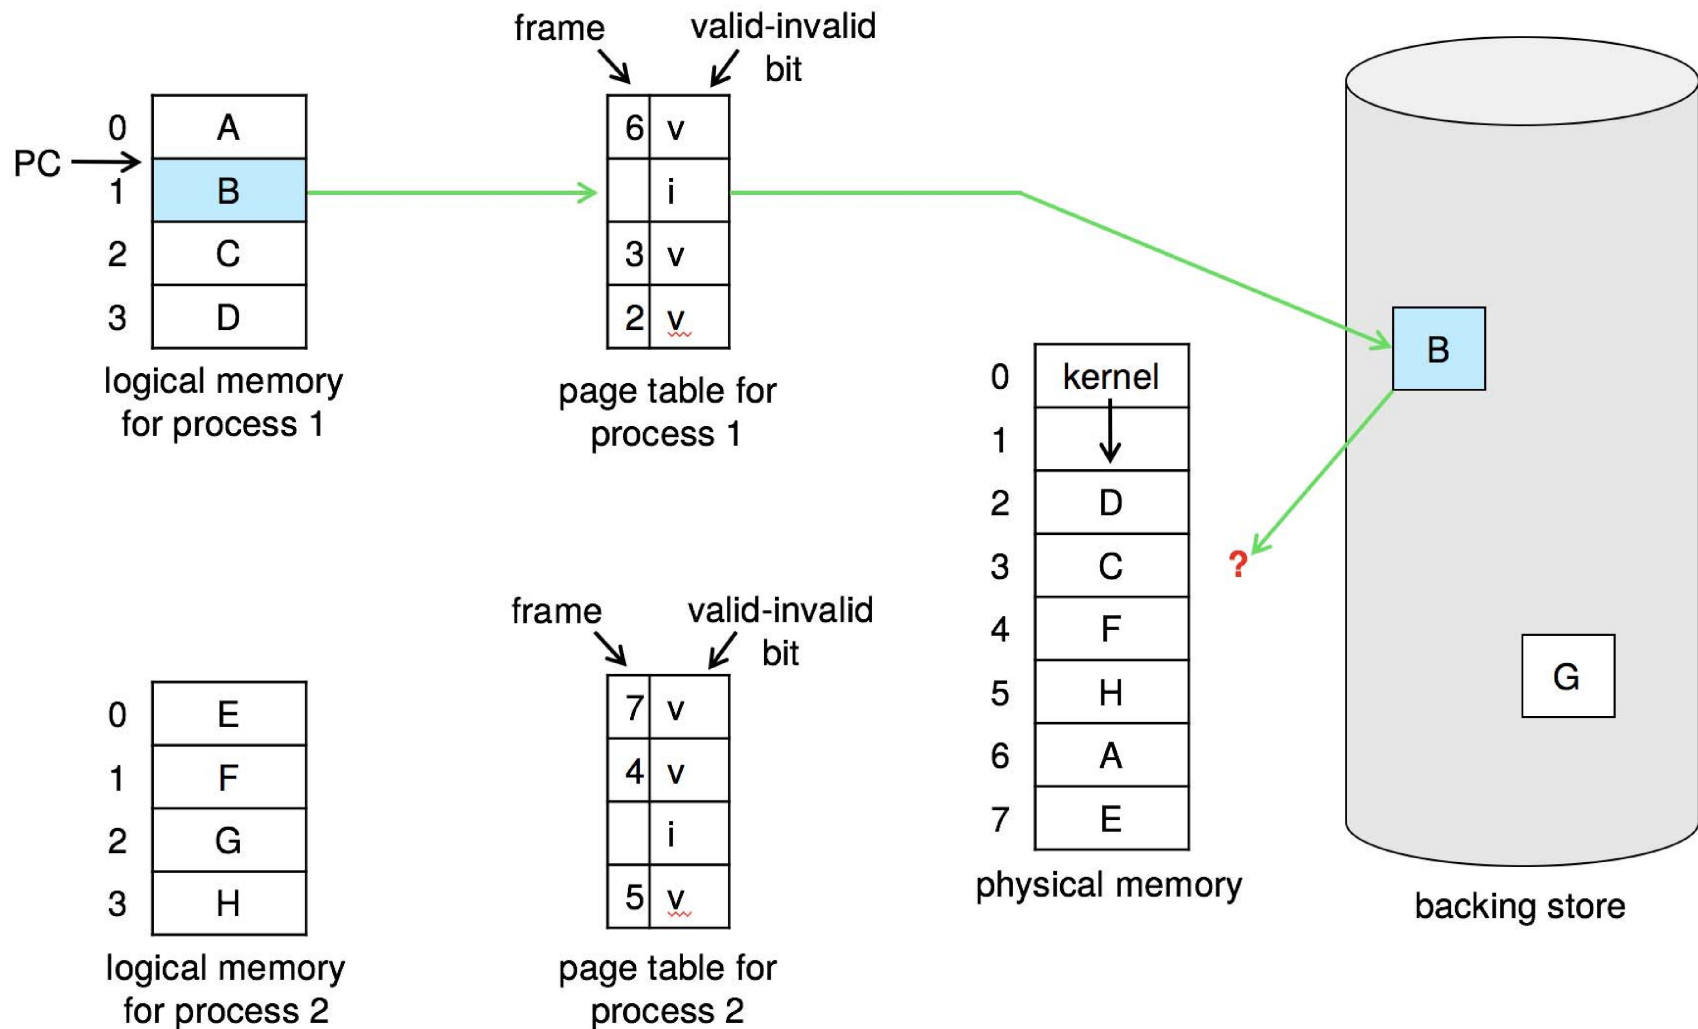

# What Happens if There is no Free Frame? (cont.)

---

- Page replacement – find some page in memory, but not really in use, page it out
  - Algorithm – terminate? swap out? replace the page?
  - Performance – want an algorithm which will result in minimum number of page faults
  
- Same page may be brought into memory several times

# Need For Page Replacement

# Basic Page Replacement

---

1. Find the location of the desired page on disk
2. Find a free frame:
  - If there is a free frame, use it
  - If there is no free frame, use a page replacement algorithm to select a *victim frame*
  - Write victim frame to disk if dirty
3. Bring the desired page into the (newly) free frame; update the page and frame tables
4. Continue the process by restarting the instruction that caused the trap

**Note now potentially 2 page transfers for page fault – increasing EAT**

# Page Replacement

# Page and Frame Replacement Algorithms

---

- **Frame-allocation algorithm** determines
  - How many frames to give each process
  - Which frames to replace
  
- **Page-replacement algorithm**
  - Want lowest page-fault rate on both first access and re-access

# Page and Frame Replacement Algorithms

---

- Evaluate algorithm by running it on a particular string of memory references (reference string) and computing the number of page faults on that string
  - String is just page numbers, not full addresses
  - Repeated access to the same page does not cause a page fault
  - Results depend on ***number of frames available***

# Page and Frame Replacement Algorithms (cont.)

---

- In all our examples, the **reference string** of referenced page numbers is

**7,0,1,2,0,3,0,4,2,3,0,3,0,3,2,1,2,0,1,7,0,1**

# Graph of Page Faults Versus the Number of Frames

# First-In-First-Out (FIFO) Algorithm

- Reference string: **7,0,1,2,0,3,0,4,2,3,0,3,0,3,2,1,2,0,1,7,0,1**
- 3 frames (3 pages can be in memory at a time per process)
- How many page faults?

15 page faults

# First-In-First-Out (FIFO) Algorithm

---

- Can vary by reference string: consider 1,2,3,4,1,2,5,1,2,3,4,5
  - Adding more frames can cause more page faults!
    - ▶ **Belady's Anomaly**
      - for some page-replacement algorithms, the page-fault rate may increase as the number of allocated frames increases

# FIFO Illustrating Belady's Anomaly

# First-In-First-Out (FIFO) Algorithm

---

- Can vary by reference string: consider 1,2,3,4,1,2,5,1,2,3,4,5
  - Adding more frames can cause more page faults!
    - ▶ **Belady's Anomaly**
      - for some page-replacement algorithms, the page-fault rate may increase as the number of allocated frames increases
- How to track ages of pages?
  - Just use a FIFO queue

# Belady's Anomaly in FIFO – Example

- Reference string: 1, 2, 3, 4, 1, 2, 5, 1, 2, 3, 4, 5
- 3 frame  $\rightarrow$  9 page faults

|    |    |    |    |    |    |    |   |   |    |    |   |
|----|----|----|----|----|----|----|---|---|----|----|---|
| 1  | 1  | 1  | 2  | 3  | 4  | 1  | 1 | 1 | 2  | 5  | 5 |
|    | 2  | 2  | 3  | 4  | 1  | 2  | 2 | 2 | 5  | 3  | 3 |
|    |    | 3  | 4  | 1  | 2  | 5  | 5 | 5 | 3  | 4  | 4 |
| PF | PF | PF | PF | PF | PF | PF | X | X | PF | PF | X |

- 4 frame  $\rightarrow$  10 page faults

|    |    |    |    |   |   |    |   |   |    |    |    |
|----|----|----|----|---|---|----|---|---|----|----|----|
| 1  | 2  | 3  | 4  | 1 | 2 | 5  | 1 | 2 | 3  | 4  | 5  |
|    | 1  | 2  | 3  | 4 | 1 | 2  | 5 | 1 | 2  | 3  | 4  |
|    |    | 1  | 2  | 3 | 4 | 1  | 2 | 5 | 1  | 2  | 3  |
|    |    |    | 1  | 2 | 3 | 4  | 4 | 4 | 5  | 1  | 2  |
| PF | PF | PF | PF | X | X | PF | X | X | PF | PF | PF |

# Optimal Algorithm

- Replace page that will not be used for longest period of time
  - 9 is optimal for the example

- How do you know this?
  - Can't read the future
- Used for measuring how well your algorithm performs

# Least Recently Used (LRU) Algorithm

- Use past knowledge rather than future
- Replace page that has not been used in the most amount of time
- Associate time of last use with each page

reference string

7 0 1 2 0 3 0 4 2 3 0 3 2 1 2 0 1 7 0 1

|   |   |   |   |  |   |  |   |   |   |   |  |   |  |   |  |   |
|---|---|---|---|--|---|--|---|---|---|---|--|---|--|---|--|---|
| 7 | 7 | 7 | 2 |  | 2 |  | 4 | 4 | 4 | 0 |  | 1 |  | 1 |  | 1 |
|   | 0 | 0 | 0 |  | 0 |  | 0 | 0 | 3 | 3 |  | 3 |  | 0 |  | 0 |
|   |   | 1 | 1 |  | 3 |  | 3 | 2 | 2 | 2 |  | 2 |  | 2 |  | 7 |

page frames

- 12 faults – better than FIFO but worse than OPT
- Generally good algorithm and frequently used
- But how to implement?

# LRU Algorithm (cont.)

---

## ■ Counter implementation

- Every page entry has a counter; every time page is referenced through this entry, copy the clock into the counter
- When a page needs to be changed, look at the counters to find smallest value
  - ▶ Search through table needed

# LRU Algorithm (cont.)

---

## ■ Stack implementation

- Keep a stack of page numbers in a double link form:
- Page referenced:
  - ▶ move it to the top
  - ▶ requires 6 pointers to be changed
- But each update more expensive
- No search for replacement

# LRU Algorithm (Cont.)

- LRU and OPT are cases of **stack algorithms** that don't have Belady's Anomaly
- Use Of A Stack to Record Most Recent Page References

reference string

4 7 0 7 1 0 1 2 1 2 7 1 2

stack  
before  
a

stack  
after  
b

# LRU Approximation Algorithms

---

- LRU needs special hardware and still slow
- **Reference bit**
  - With each page associate a bit, initially = 0
  - When page is referenced bit set to 1
  - Replace any with reference bit = 0 (if one exists)
    - ▶ We do not know the order, however

# LRU Approximation Algorithms (cont.)

---

## ■ Second-chance algorithm

- Generally FIFO, plus hardware-provided reference bit
- **Clock** replacement
- If page to be replaced has
  - ▶ Reference bit = 0 -> replace it
  - ▶ reference bit = 1 then:
    - set reference bit 0, leave page in memory
    - replace next page, subject to same rules

# Second-chance Algorithm

# Enhanced Second-Chance Algorithm

---

- Improve algorithm by using reference bit and modify bit (if available)
- Take ordered pair (reference, modify):
  1. (0, 0) neither recently used nor modified – best page to replace
  2. (0, 1) not recently used but modified – not quite as good, must write out before replacement
  3. (1, 0) recently used but clean – probably will be used again soon
  4. (1, 1) recently used and modified – probably will be used again soon and need to write out before replacement

# Enhanced Second-Chance Algorithm (cont.)

---

- When page replacement called for, use the clock scheme but use the four classes.
- Replace page in lowest non-empty class
  - Might need to search circular queue several times
- The major difference between this algorithm and the simpler clock algorithm is that here we give preference to those pages that have been modified to reduce the number of I/Os required.
